

**Empowering Yield Farmers with
Institutional Technology**

**PROSPECTIVE
INVESTOR UPDATE**

3rd November, 2022

Data Input Sampling

The image shows the feasibility of ML prediction on the Arbitrum USDT pool, through the quality of historical data captured from the pool.

The top left image shows:

- There are a total of 14 principal components in the data.
- The 1st, 2nd, 3rd, and 4th components dominates in the data, as their strengths are highest.

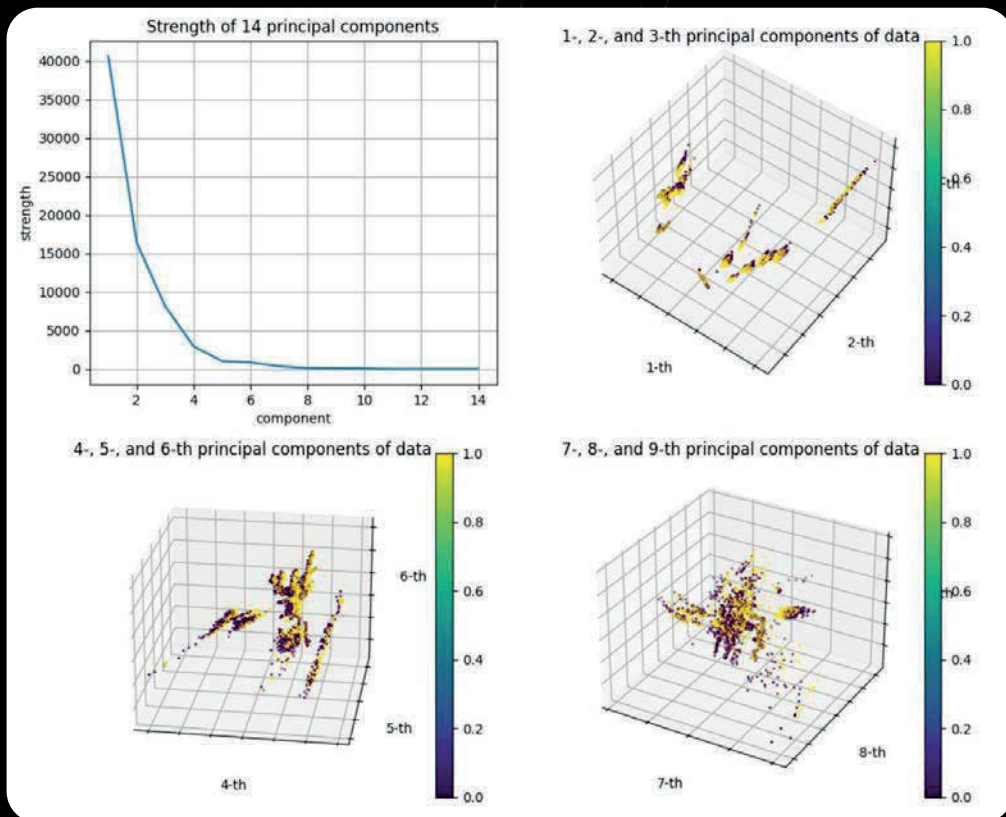

Diagram 1

Data Input Sampling

This video (top right of diagram 1) shows the 1st 2nd and 3rd components of the data points.

- The (bright) yellow points are rising, in that their next points give higher FROI.
- The dark points are dropping, in that their next points give lower (or equal) FROI.

Where FROI is the expected farming rewards.

Data Input Sampling

This image shows the 7th, 8th and 9th components.

The bright and dark points are mixed together, there cannot be a simple surface separating them.

This image suggests the data inputs of these components are not worth including in future models and will be removed in further training of our model.

We plan to replace these with other components such as bridge or token volume.

Timeline for MVP Test Results

During our most recent testing and model training period, we noticed a number of anomalies with some of the final outputs. These irregularities were found to be contributing to the abnormal test results, and this led us to the discovery that our data we had received was incorrect. Several intervals had small but erratic changes to APY, which was enough to cause sub-optimal results, and after identifying this issue we reached out to our internal network for a solution.

Max from Layerzero introduced us to [Blocklabs](#), who contributed to the alpha release for Stargate. They expect to be able to deliver the necessary data with 100% accuracy in less than two weeks. Depending on the quality of the data and this batch of test results, we may lock in a long term partnership. After we have received this new dataset, we will be retraining our prediction model and providing the test results for all our prospective investors.

We don't expect any of these hurdles to contribute to any sizeable delay, with our MVP development continuing as planned for launch in Q1 2023.

Dapp

The Dapp is going through some final aesthetical changes as we push the last version for the MVP and these changes to the Dapp have now gone under review. The final version of the Dapp will be ready to present next week. All Solidity development work is expected to be finished before the 10th of November.

A demo version of the vault page in use is viewable below.

Raise

One of our principal investors from Star Beta had been patiently waiting for our company incorporation before sending their pre-seed funding commitment. Although there had been a delay, Mozaic is now incorporated as a legal entity in the British Virgin Islands.

However due a drastic change in personal circumstances, this investor has informed us that they need to withdraw their commitment, citing urgent liquidity needs as the primary reason for their withdrawal. Due to the urgency of their situation and our personal relationship with the individual, we have excused them of this commitment, however, we are now faced with a deficit of US\$400,000 to fill in our pre-seed round.

We would like to personally open a discussion with you with regards to this change in circumstances. Currently, we see two options; one would be continuing with the reduced pre-seed round– meaning less overhead supply for our seed investors, or two, seeking another investor(s) to fully fund and close the pre-seed round at the original size. We would welcome any advice on industry best-practices with proceeding forward.

Marketing

We also have several upcoming hosted events, including a podcast with Certik scheduled for the 10th of November, with more leading into the rest of the month. These include Discord AMAs, twitter spaces, community gamification and much more.

We're also launching our Hoplite Governance NFTs to give Mozaic's community early access into the Mozaic ecosystem as we assemble the phalanx dao. All Funds raised from the oNFT mint will be used to provide liquidity for the Mozaic ecosystem and the team will not profit from this sale in any way.

Mozaic Media Kit has been uploaded to the website and [docs](#). This will help guide the community driven marketing campaign.

Next Steps

In the coming weeks we wish to complete the following;

- Full Dapp demo ready to present
- Solidity contracts ready to live test
- First podcast appearance with Certik
- Start contract with Blocklabs
- Identify and start pulling additional data for ML training
- Launch Hoplite oNFTs
